Deliverable: Versioning, Packaging, & Release

To package our software, we plan to use the arch build system. Specifically the PKGBUILD file from the arch build system that is specifically made for cutter. With this file, when you run the makepkg command in the terminal, it creates a package with the cutter software within it.

When we attempted to run this however, we didn't have the proper tools installed to run it properly in time for the deliverable and are still waiting on a response from the developers about issue 1. Instead, we have provided a link to the git pull for the developers for Cutter

Link to Git Pull Request:https://github.com/rizinorg/cutter/pull/3297

The Pull Request hasn't merged yet, so we don't have the git tag release from the developers in the cutter.
